The Post's visual journalism, which involves staff throughout the newsroom, has attracted large audiences and contributed to record subscriber growth.

Six of the seven most visited stories in The Washington Post's history have been graphics, including the [coronavirus simulator](#) that became the most visited article in The Post's history, with more than three times as many visits as the second. It also includes this year's [Democratic candidate quiz](#), which set the record for converting readers to subscribers.

The human brain evolved to detect **patterns**...

The human brain evolved to detect **patterns**...

...and the
exceptions and
departures from
those patterns.

The relationship between patterns and their exceptions is a key principle of data exploration: uncover patterns and trends, but don't forget the exceptions to those patterns and trends.

John W. Tukey

Encoding data

Data visualization consists of mapping data onto attributes of objects—commonly abstract shapes.

And the great news is that this stuff isn't magic.

The same way that anybody can learn to write well, anybody can learn to design pretty decent data visualizations and data stories.

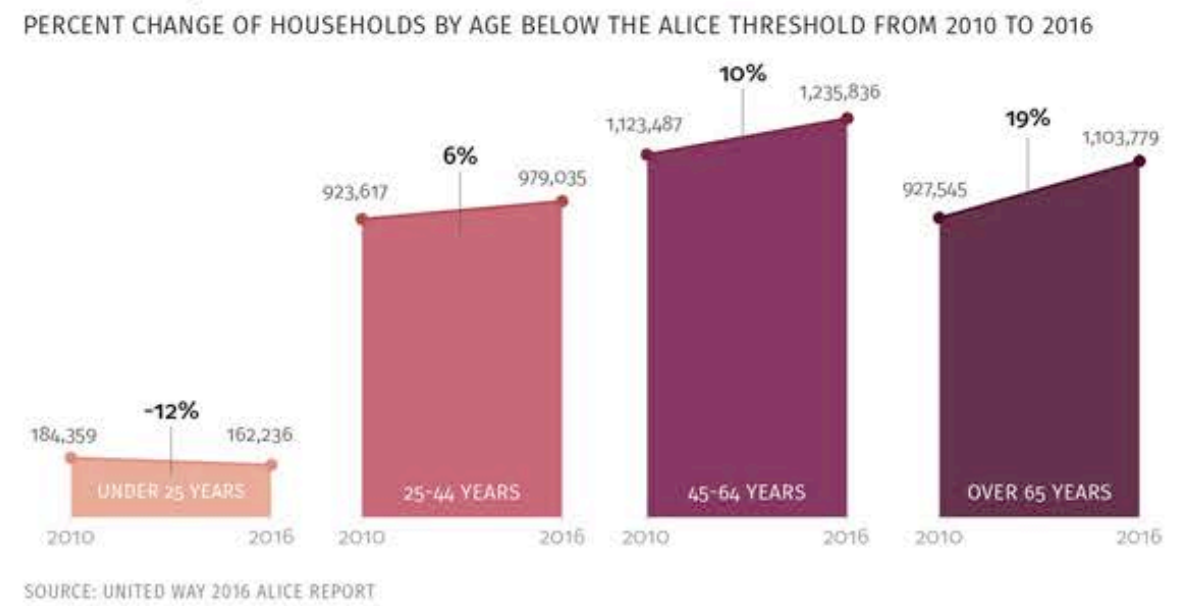

FLORIDA: WHY ARE SO MANY SENIORS STRUGGLING?

Asset Limited, Income Constrained, Employed (ALICE) is a segment of the U.S. population who do not meet federal poverty levels but are struggling to make ends meet. In Florida, households 65 years and older saw the greatest increases below the ALICE threshold across all ethnic and racial groups; however, total households for those 25 years and under decreased. Florida also leads the nation with the greatest number of seniors with many dependent on Social Security as their primary source of income. Housing is at an all-time high negatively affecting the overall health of many low-income Floridians. With formal care costs out of reach for most households, informal caregivers will continue to feel the financial burden of long term care. As more Floridians struggle to get by, will Florida have policies in place to address the monumental impacts of an aging population?

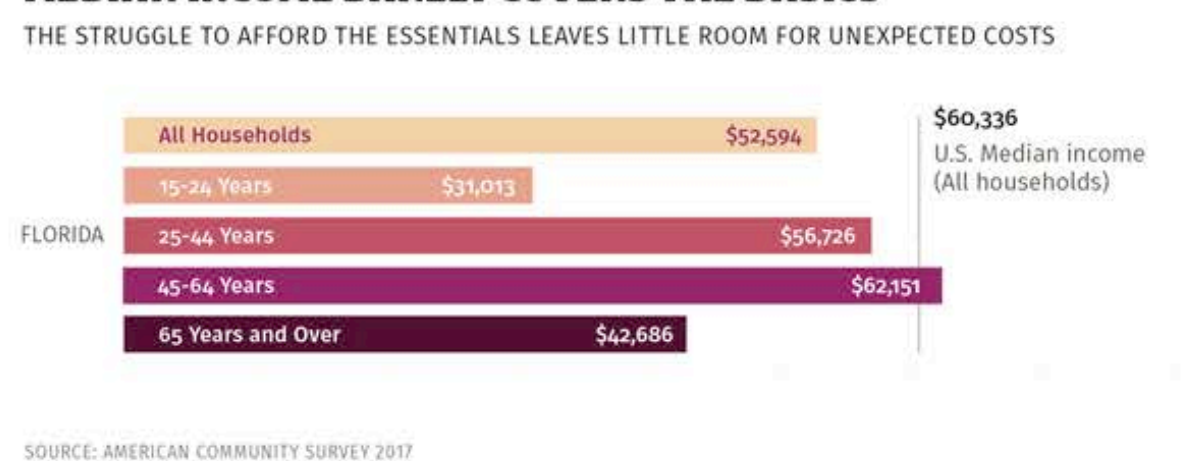

NEARLY 50% OF FLORIDIANS FIGHT TO SURVIVE

SENIORS, 45-64 YEAR OLDS INCREASINGLY STRUGGLE

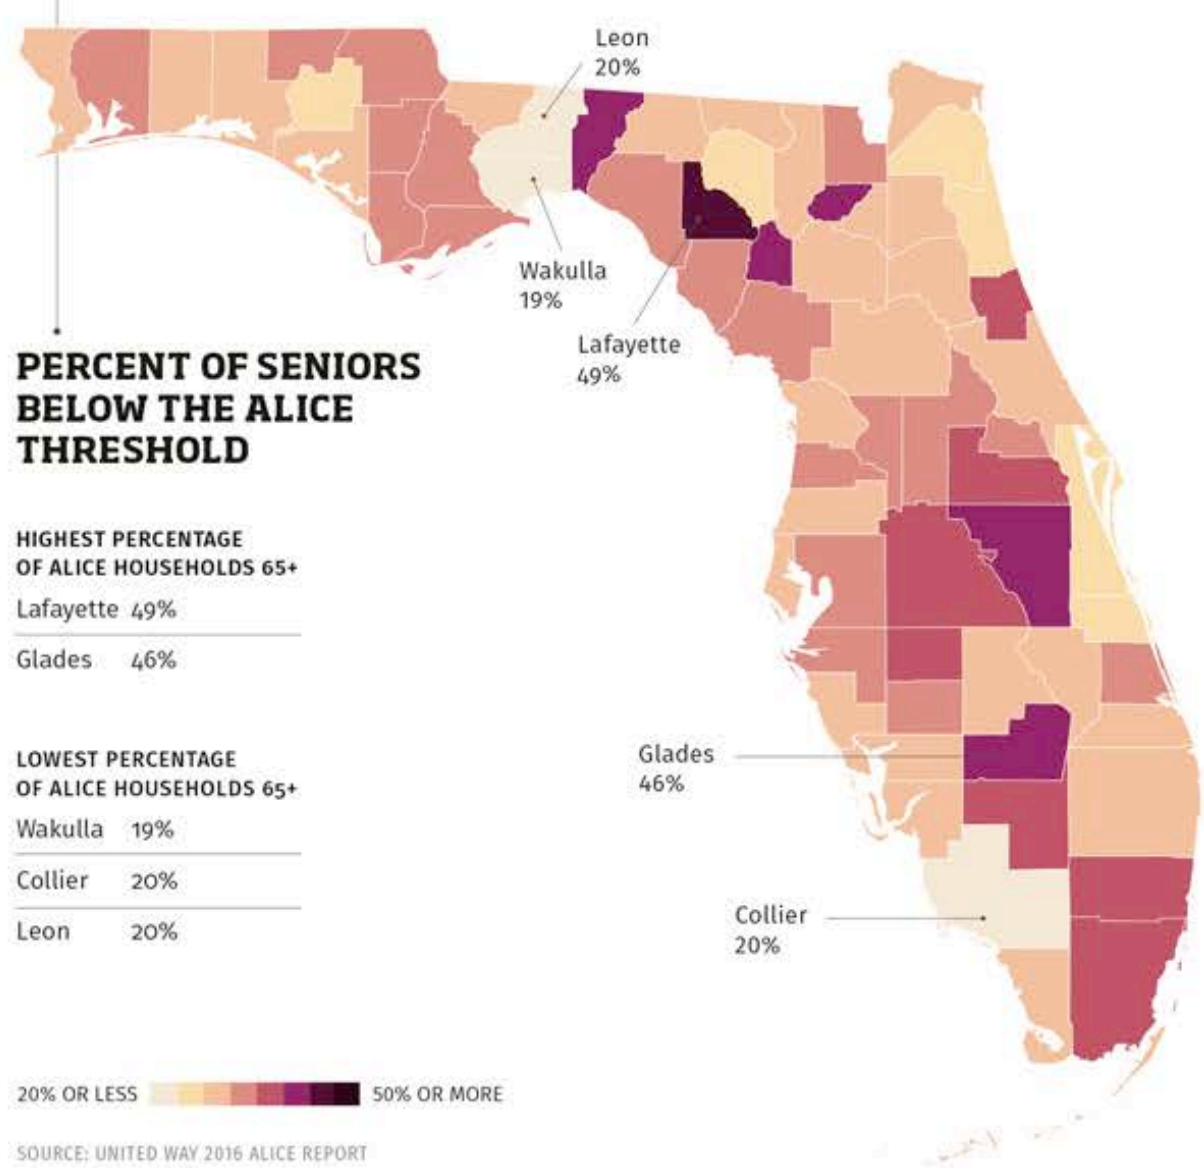

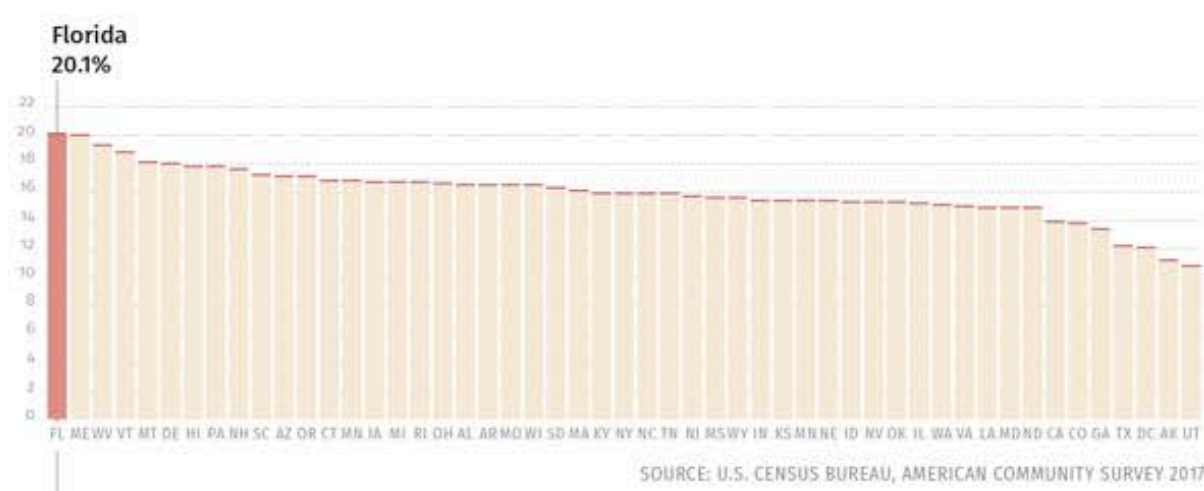

MEDIAN INCOME BARELY COVERS THE BASICS

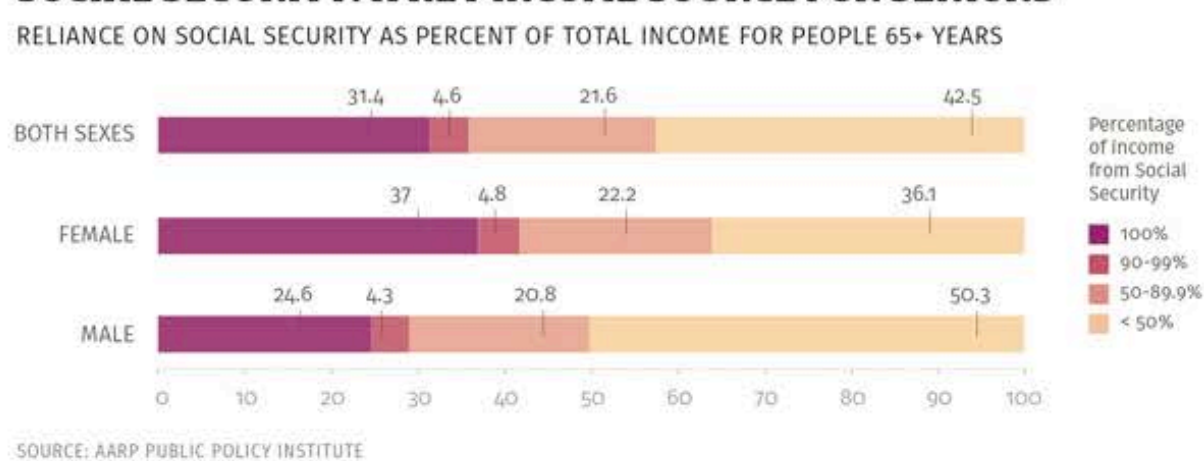

FLORIDA: THE NATION'S OLDEST STATE

MAINE, WEST VIRGINIA AND VERMONT FOLLOW WITH THE HIGHEST PERCENTAGE OF SENIORS (65+)

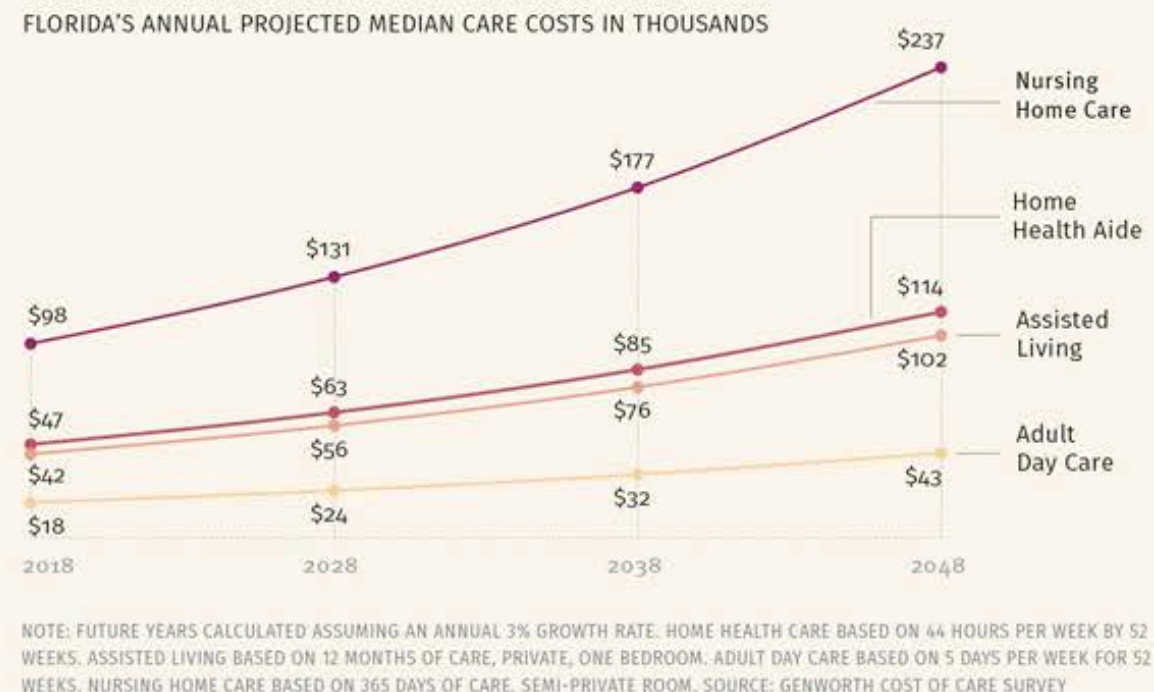

SOCIAL SECURITY: A KEY INCOME SOURCE FOR SENIORS

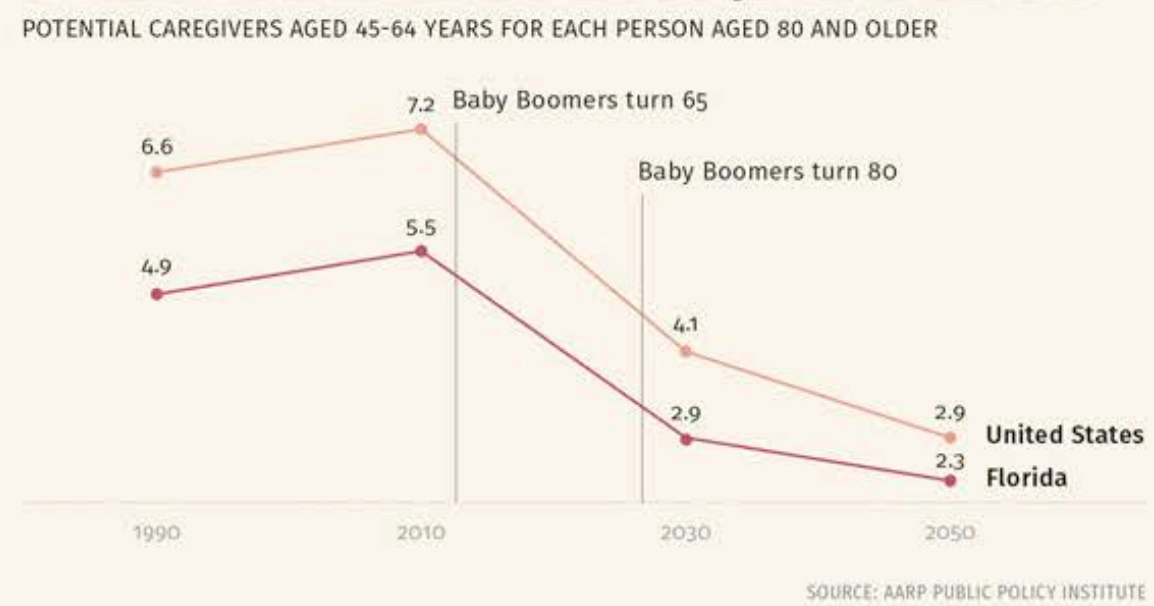

LONG TERM CARE STRAIN ON THE HORIZON

Costs for longterm care ("custodial care") support in Florida will continue to increase at alarming rates forcing vulnerable populations to seek alternatives. Medicare can cover a fraction of costs and the bulk of the financial burden falls on individuals and families. Medicaid is only available for Americans with the lowest incomes with caveats. When it comes to long term care, ALICE households are forced further to the margins.

FORMAL CARE COSTS WILL CONTINUE TO OUTPACE U.S. INFLATION RATES

NUMBER OF FAMILY CAREGIVERS PROJECTED TO PLUNGE

WHAT COULD FLORIDA DO TO HELP SENIORS?

- IMPROVE OVERALL LONG TERM SERVICES AND SUPPORT (LTSS):** Quality of life would increase, including the promise for seniors and adults with disabilities to afford housing.
- EXPAND HOME AND COMMUNITY-BASED SERVICES (HCBS):** More Floridians could avoid costly nursing homes and family caregivers would be able to receive assistance.
- EXPAND MEDICAID:** Non-elderly adults without dependents could be covered and the health coverage gap for nearly 400,000 Floridians would be reduced.

GRAPHIC: DEB PANG DAVIS / JMM622 INTRO TO DATA VISUALIZATION

Wed 4/26/2023 5:08 PM

I have really enjoyed this course, wanted to pull my hair out many times, but it has completely changed the way I think about charts and design.

NEARLY 50% OF FLORIDIANS ARE ABOVE THE ALICE THRESHOLD

SENIORS, 65 AND OVER, ARE THE MOST VULNERABLE

MEDIAN INCOME BARELY COVERS THE BASICS

THE STRUGGLE TO AFFORD THE ESSENTIALS LEAVES LITTLE ROOM FOR UNEXPECTED COSTS

SOCIAL SECURITY: A KEY INCOME SOURCE FOR SENIORS

RELIANCE ON SOCIAL SECURITY AS PERCENT OF TOTAL INCOME FOR PEOPLE 65+ YEARS

WHAT COULD FLORIDA DO TO HELP SENIORS?

ACCORDING TO AARP, COMPREHENSIVE PEOPLE-FOCUSED POLICIES COULD MAKE A BIG DIFFERENCE

- IMPROVE OVERALL LONG TERM SERVICES AND SUPPORT (LTSS):** Quality of life would increase, including the promise for seniors and adults with disabilities to afford housing.
- EXPAND HOME AND COMMUNITY-BASED SERVICES (HCBS):** More Floridians could avoid costly nursing homes and family caregivers would be able to receive assistance.
- EXPAND MEDICAID:** Non-elderly adults without dependents could be covered and the health coverage gap for nearly 400,000 Floridians would be reduced.

How and why my teaching and thinking have evolved

Generative art by Nadieh Bremer

The first reason is that I get variations of this question regularly:

“What are the **rules** of data visualization design”?

“Rules”?

Some of these books are very intimidating to beginners because of how **stern** and **prescriptive** they are.

Even what the most common “rules” of visualization have shaky foundations and can be questioned

“Bar graphs must always start at 0”

Non-zero baseline

Zero baseline

Bar graphs must
always start at 0!

Bar graphs must
always start at 0!

This is bad,
never do it!

Bar graphs must always start at 0!

This is bad, never do it!

But this is fine (in theory...)

Bar graphs must always start at 0!

This is bad, never do it!

But this is fine (in theory...)

From 'How Charts Lie':

The encodings in a line chart are position and angle, and these don't get distorted if we set a baseline that is closer to the first data point. These two lines look exactly the same, and neither lies; the only difference is that on the first one I emphasize the baseline —because it's 0— and on the second I don't —as the baseline is like any other gridline, and I want to make clear *that it's not 0*:

Chart	Baseline	Value Range
Left	0%	65% - 80%
Right	50%	65% - 80%

Bar graphs must
always start at 0!

This is bad,
never do it!

But this
is fine

Do readers focus
on height when
reading a bar graph?

However...

Bar graphs must always start at 0!

This is bad, never do it!

But this is fine

Do readers focus on height when reading a bar graph?

Or do they focus mostly on the upper edges and read the Y-axis scale?

However...

Bar graphs must always start at 0!

This is bad, never do it!

But this is fine

Do readers focus on height when reading a bar graph?

Or do they focus mostly on the upper edges and read the Y-axis scale?

==

...In which case a non-0 bar graph is neither better nor worse than a non-0 line graph

However...

Bar graphs must always start at 0!

This is bad, never do it!

But this is fine

Do readers focus on height when reading a bar graph?

Or do they focus mostly on the upper edges and read the Y-axis scale?

==

...In which case a non-0 bar graph is neither better nor worse than a non-0 line graph

However...

This said, **I still recommend that bar graphs start at 0.** The **reason** isn't that they may be misleading otherwise, but that the encoding we use when building them is height/length. Therefore, bar height/length should be proportional to the quantities they represent (a line graph, on the other hand, uses relative position as encoding).

For more information:

https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2566968

<https://eagereyes.org/papers/an-empire-built-on-sand>

The second reason for changing the way I teach visualization is observing its diversity:

Ed Hawkins's 'Warming stripes' (read more: <https://chezvoila.com/blog/warmingstripes/>)

**No labels?
No scales?
WTF?**

Ed Hawkins defined a **goal**:

He wanted general audiences to pay attention to the main point his chart makes.
Not to understand the data in depth, or to analyze it. Just to look at it and become curious.

He also made the graphic look colorful and fun.

Hawkins designed his graphic knowing little about data visualization “rules” or “principles”.

Hmmm...

Ed Hawkins defined a **goal**:

He wanted general audiences to pay attention to the main point his chart makes.
Not to understand the data in depth, or to analyze it. Just to look at it and become curious.

He also made the graphic look colorful and fun.

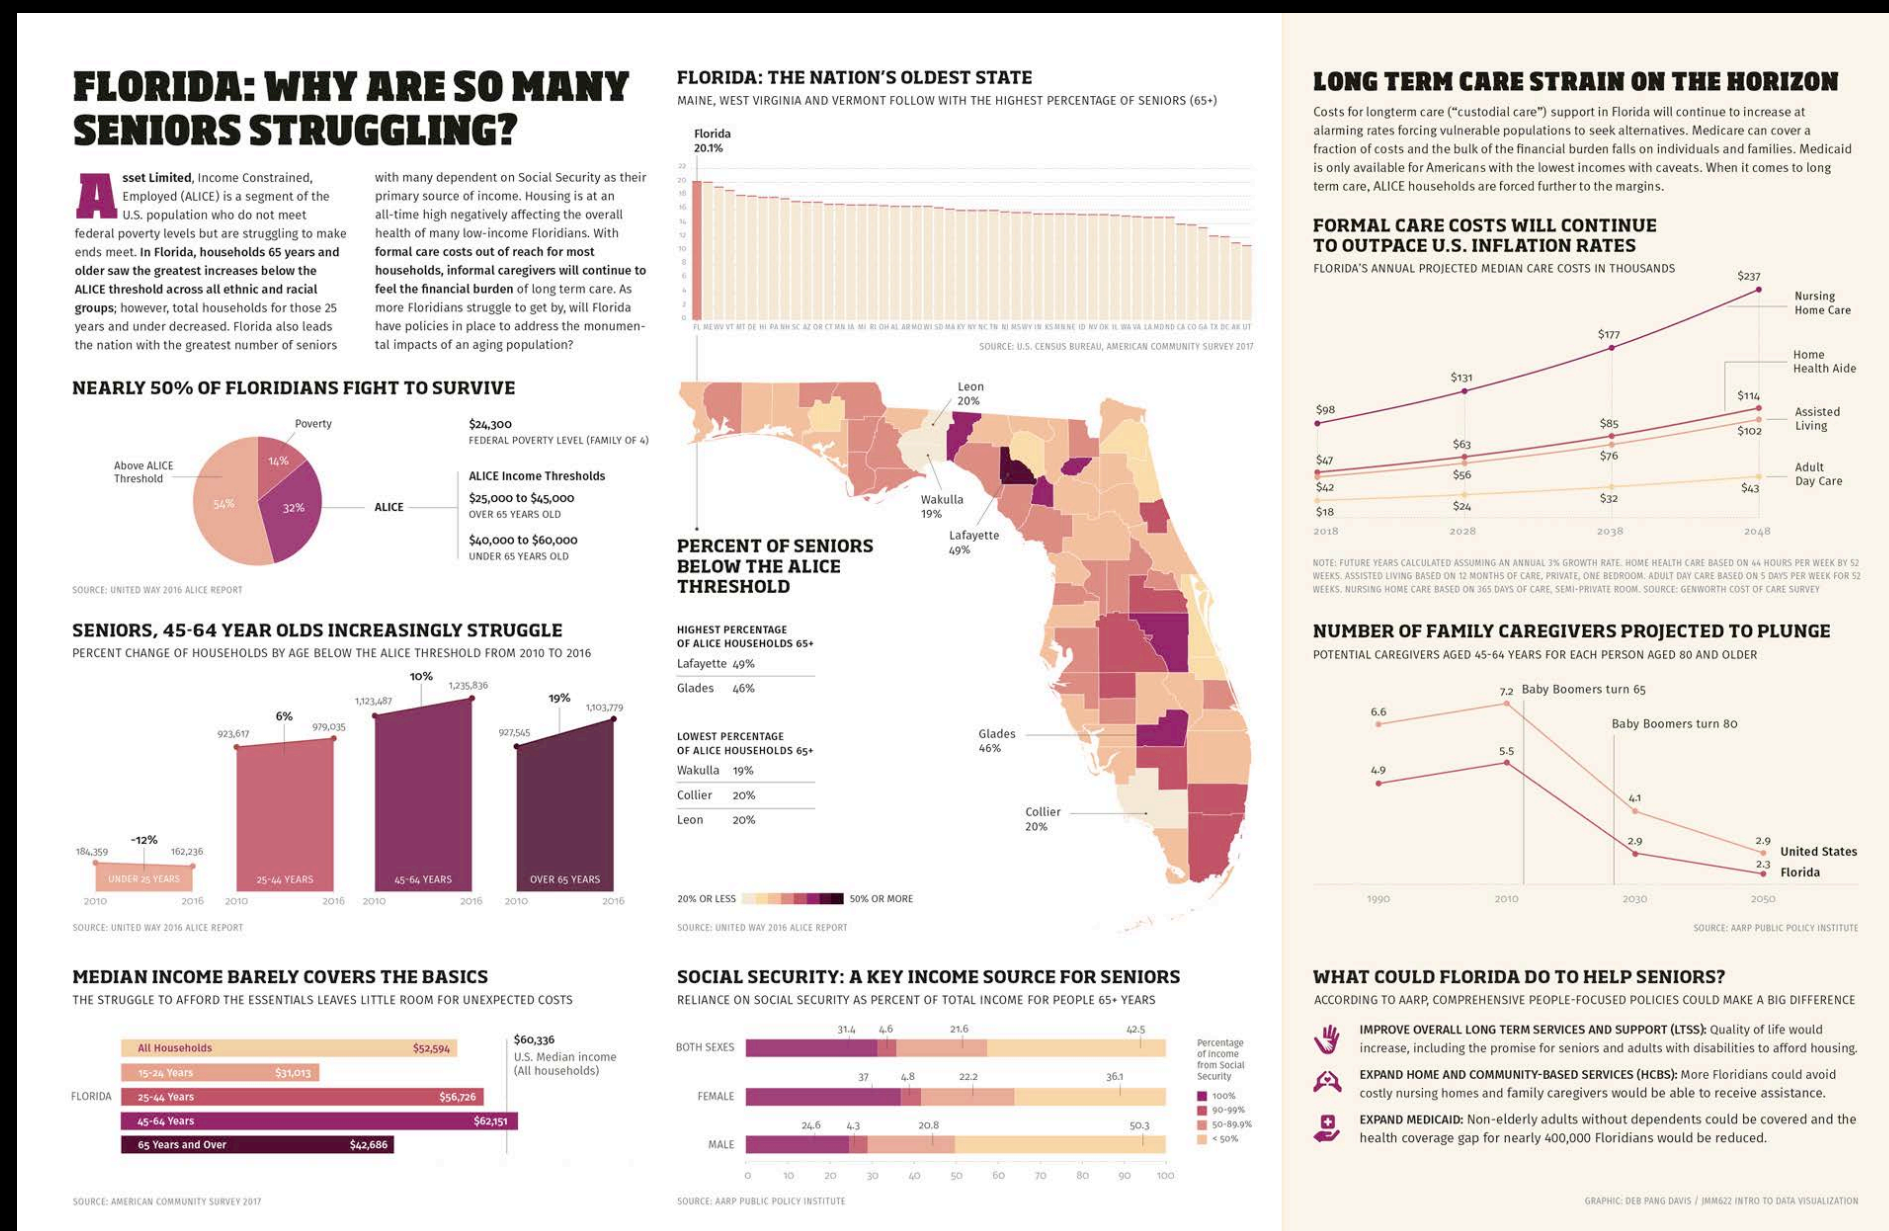

Are most people more likely to look at this...?

...or at this?

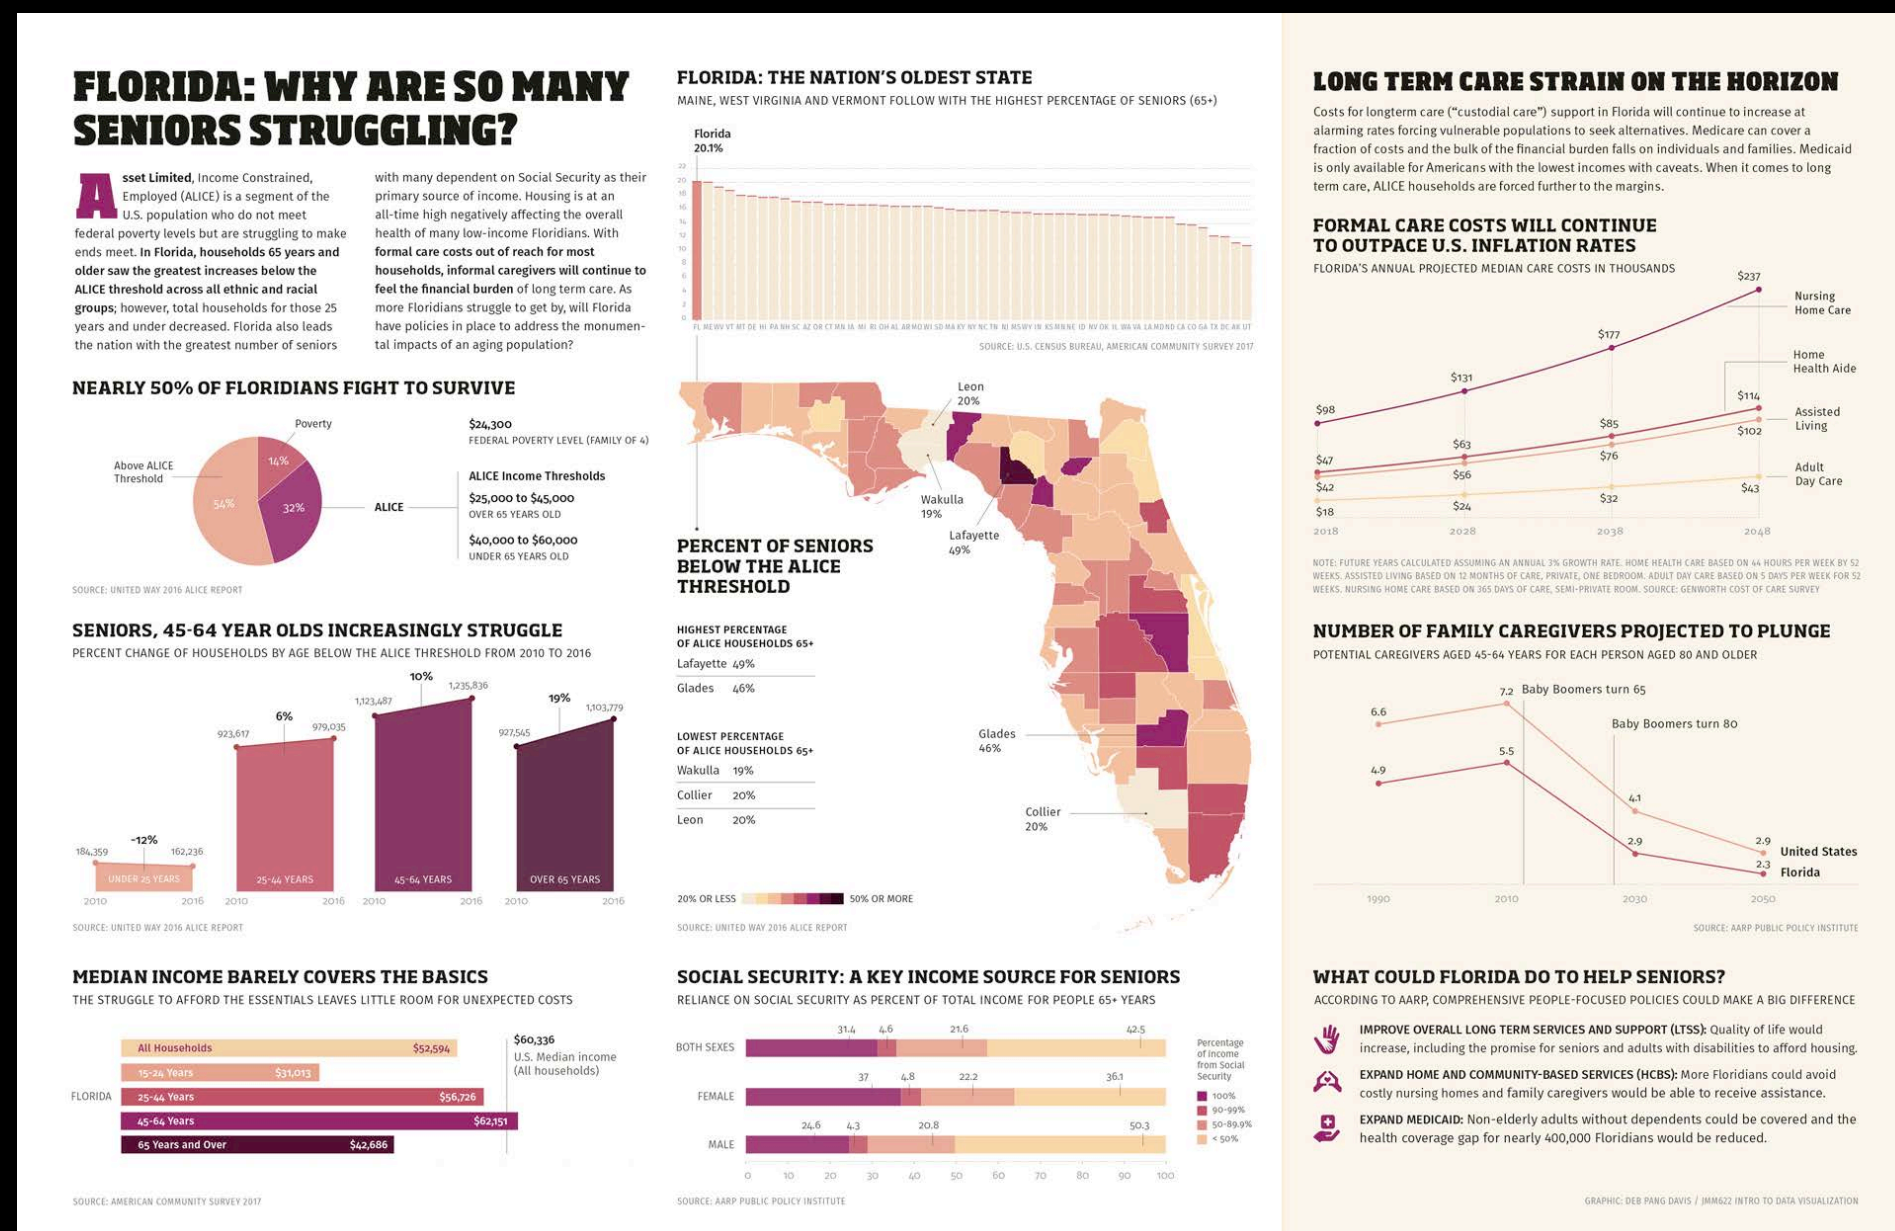

I've come to realize that these visualizations share an underlying **grammar** but they differ in fundamental ways. They might be examples of different visualization **dialects**.

I've come to realize that these visualizations share an underlying **grammar** but they differ in fundamental ways. They might be examples of different visualization **dialects**.

 Emotive ○

Teaching visualization:

Pretty much like writing, visualization design doesn't consist of applying "**rules**".

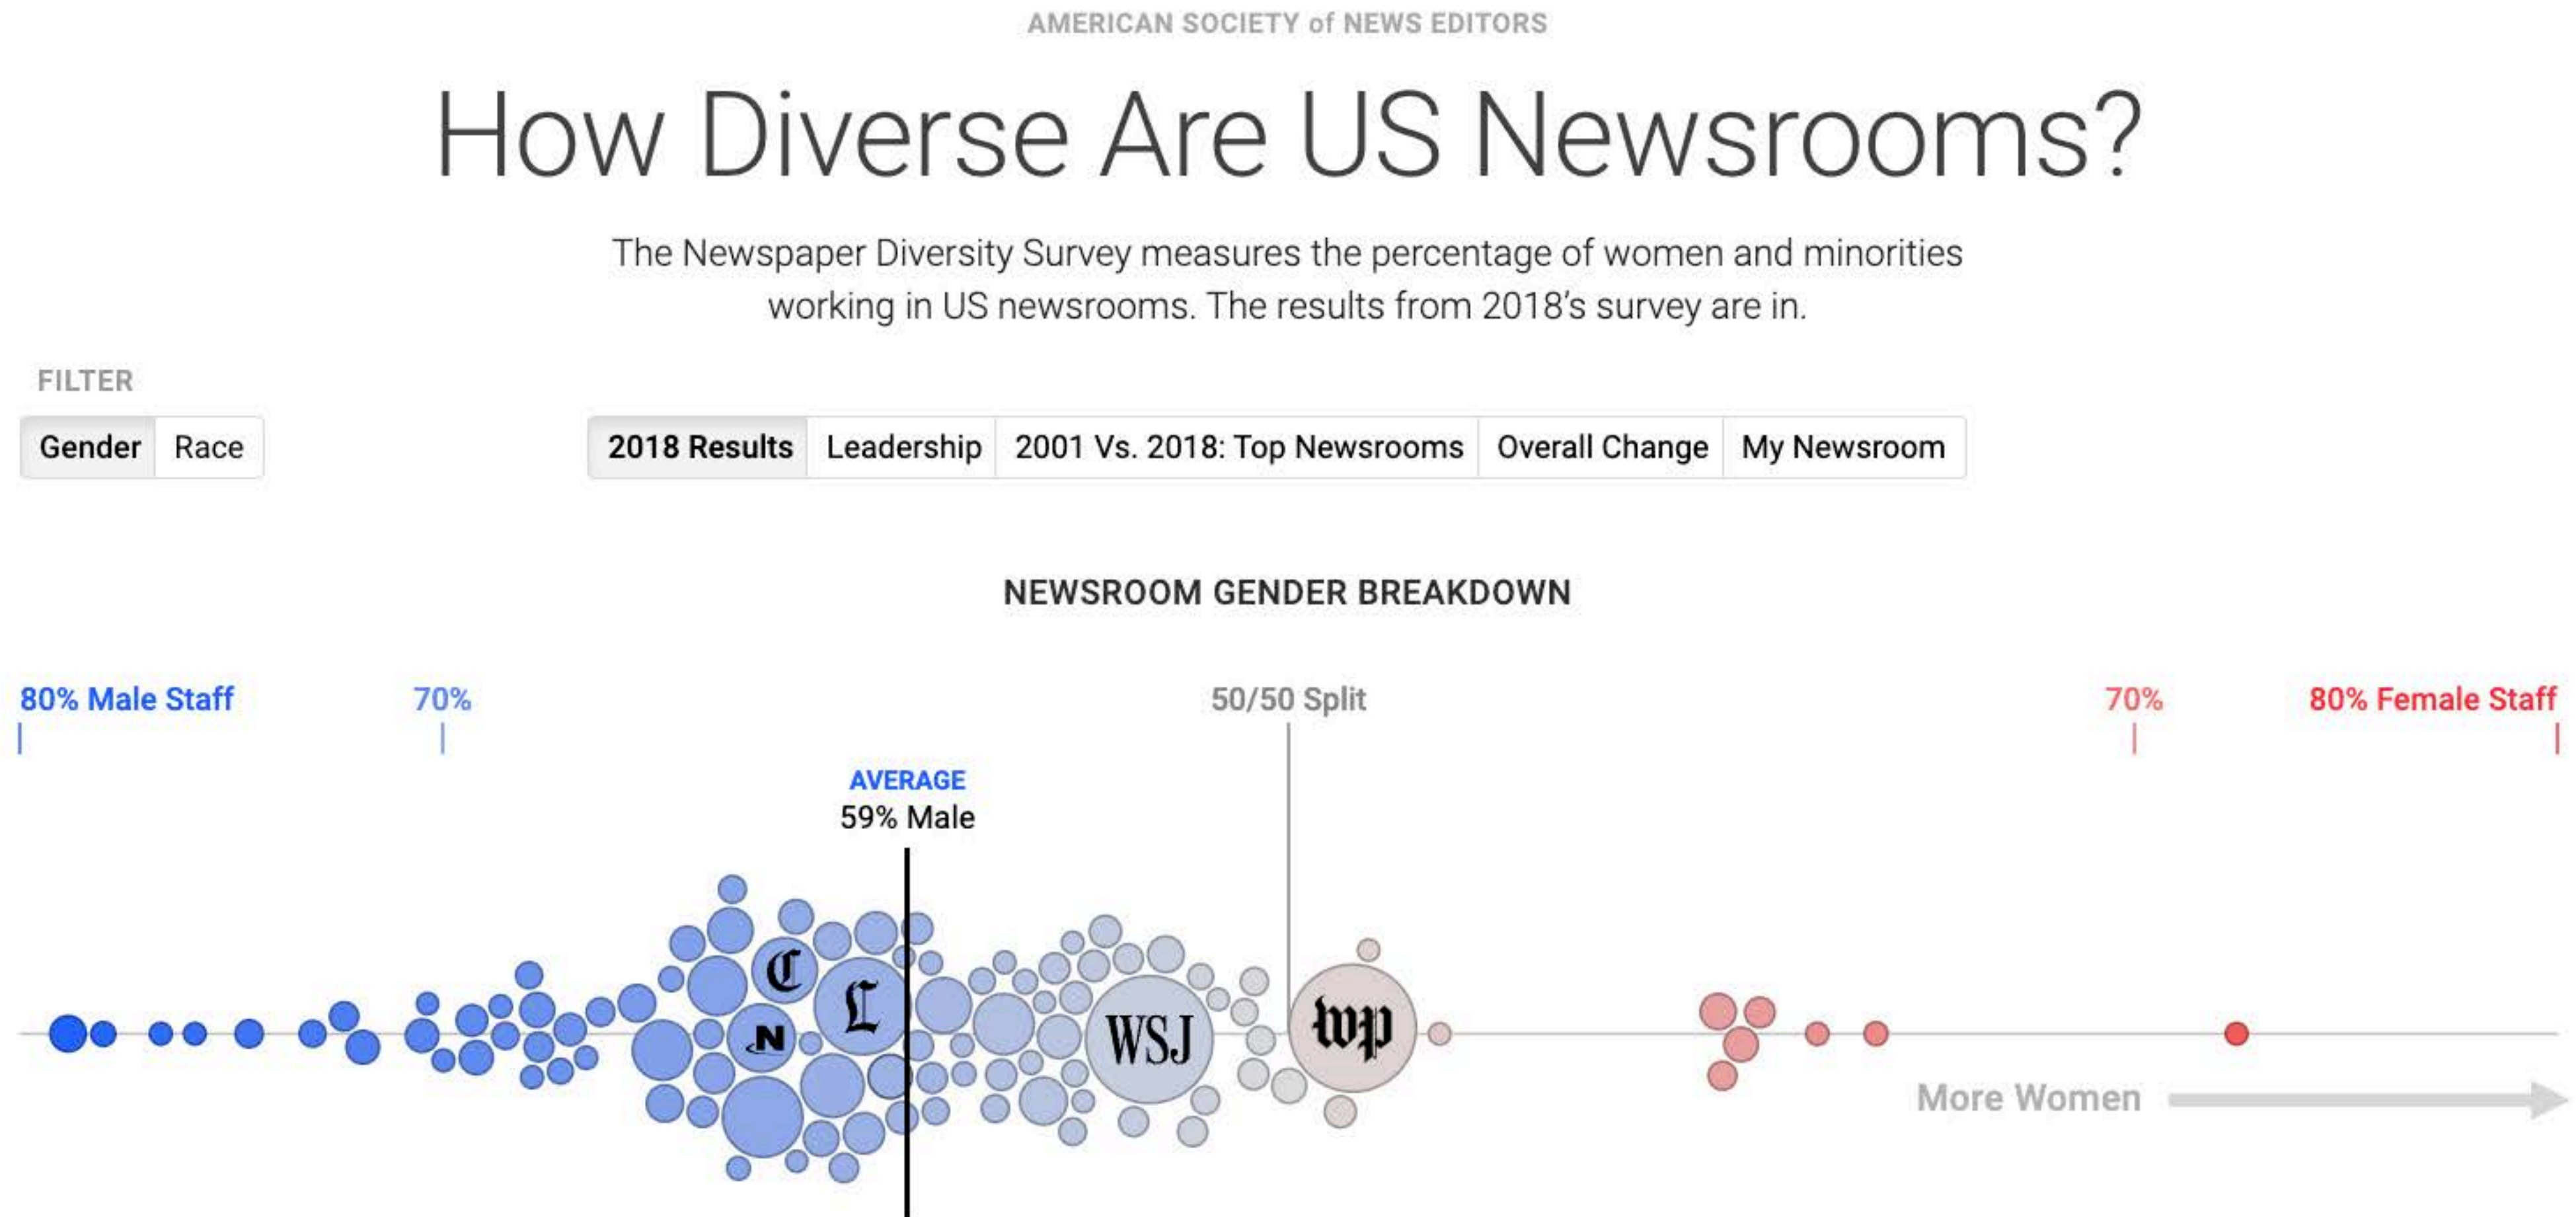

Rather, it's based on making **justifiable** —ethically, functionally, aesthetically— **choices** considering **goals** and **constraints**.

What I teach

A good exercise: Reverse-engineering existing visualizations

“If I were the designer who created this, what choices would lead me to this solution?”

<https://googletrends.github.io/asne/>

Visual vocabulary

Designing with data

There are so many ways to visualise data - how do we know which one to pick? Use the categories across the top to decide which data relationship is most important in your story, then look at the different types of chart within the category to form some initial ideas about what might work best. This list is not meant to be exhaustive, nor a wizard, but is a useful starting point for making informative and meaningful data visualisations.

But I also try to teach them how to reason about their choices

Figure 2 - Main nationalities of arriving migrants – 2016

Greece

The background is a complex generative art piece. It features a central, bright, circular sunburst or starburst pattern that radiates outwards. The lines of the sunburst are thin and numerous, creating a dense, web-like structure. The color palette is primarily warm, with shades of brown, tan, and beige. Scattered throughout the background are numerous semi-transparent, light-colored circles of varying sizes, some of which overlap the sunburst lines. The overall effect is a textured, organic, and somewhat chaotic visual field.

Multi-scale Modeling and Assessment of Malaria Risk in Northern South America

Alimi, T. O.¹; Fuller, D. O.^{1,2} and Beier, J.C.^{1,3}

¹ Abess Center for Ecosystem Science and Policy; ² Department of Geography and Regional Studies; ³ Department of Epidemiology and Public Health, University of Miami

1. Introduction

The public health problem posed by malaria has made it a top priority for control efforts and the general consensus globally, is that its elimination is crucial for continued international development. Consequently, there is ongoing research in different regions including South America (SA) to better understand the disease dynamics with the intent that findings may establish scientific framework that would support the development of new intervention strategies for malaria elimination in areas with seasonal malaria. One of such investigations is undertaken by the International Centers of Excellence in Malaria Research (ICEMR) under a National Institutes of Health (NIH) grant.

While only about 3% of the global malaria burden is borne by SA¹, undertaking malaria research in the region is currently important because an estimated 23million people are still at risk² and approximately about 80% of clinical cases are found in Northern South America (NSA)³. A key factor limiting effective control is lack of data and uneven implementation of control measures, including use of bed-nets, sprays, early diagnosis, and treatment. As part of the ICEMR investigation, this project seeks to model the spatial patterns of malaria risk in NSA through vector distribution and land-use changes. Furthermore, I intend to investigate the perceptions of malaria risk in order to identify barriers to adoption and how they can be circumvented.

2. Significance

Spatial distribution of malaria risk is still perceived as broadly categorized by the WHO's traditional risk maps which are highly generalized, of low resolution and have broad categories with uncertain boundaries (see da Nunes-Silva et al. 2012). There is need for up- to-date high resolution risk maps which can aid malaria control efforts. Secondly, modeling distribution of principal malaria vectors and land use changes which may explain the observed distribution and risk are useful tools which would guide future management strategies. Finally, understanding the perceptions of at risk populations may help address barriers to adoption of interventions and influence policies. Overall, findings will empower NMCPs to achieve effective control and move them closer to elimination.

3. Specific Aims

- Specific Aim 1: Model the spatial patterns of malaria risk through vector distribution and land use changes
 - Hypothesis 1.1: GIS-based Multi-Criteria Evaluation (MCE) model can accurately predict spatial extent of malaria risk areas. **Objective:** Generate risk maps that represent risk of malaria transmission.
 - Hypothesis 1.2: The Maximum Entropy (Maxent) model can accurately depict actual and predict potential distribution of three *Anopheles* species. **Objective:** Model observed and potential spread of *An. albimanus*, *An. darlingi*, and *An. nuneztovari*.
 - Hypothesis 1.3: Land- use changes can explain the variations in predicted malaria risk. **Objective:** Characterize land use land cover (LULC) and investigate changes in areas of risk.
- Specific Aim 2: Investigate the perceptions of malaria risk in order to identify barriers to adoption and how they can be circumvented.
 - Hypothesis 2.1: Knowledge of perception of malaria risk can aid design of malaria control strategies. **Objective:** Obtain and analyze data on subjective perceptions of risk.
 - Hypothesis 2.2: Identification of barriers to adoption of malaria control interventions provide means of tackling them. **Objective:** Analyze data addressing perceived barriers and policy implications

*Only ongoing work on Hypothesis 1.1 in presented here

4. Materials and Methods

- **Study Area:** is NSA comprising of ten countries- Bolivia, Brazil, Colombia, Ecuador, French Guiana, Guyana, Panama, Peru, Suriname and Venezuela. These countries account for approximately 90% of clinical cases in the region hence, the choice as study area (Fig. 1).

Figure1: Map of study area

- **Research Approach:** Due to the complexity of malaria problem, I'm employing an interdisciplinary approach to address the problem (Fig. 2).

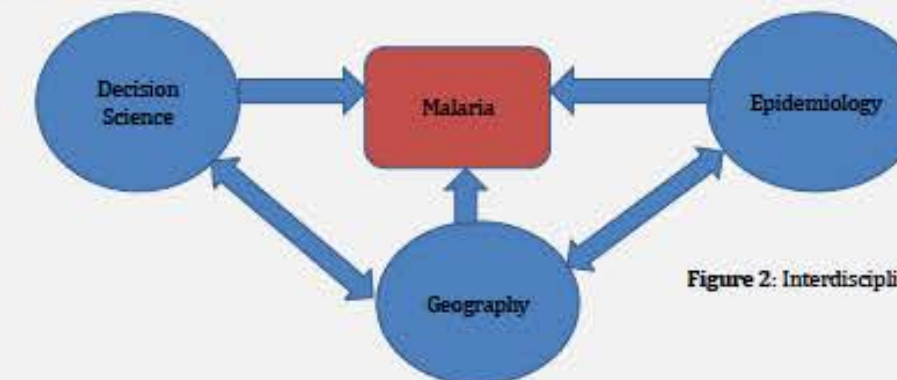

Figure 2: Interdisciplinary approach

- **Materials:** Raster data layers of environmental, climatic and anthropogenic parameters from satellite imageries, weather monitoring stations, global land cover and population data were collected from Worldclim, Digital Charts of the World, Globcover and Landsat. Vector data was collected from field sampling by our collaborators and the Walter Reed Biosystematics Unit. Sociological data would be collected through questionnaires to be administered in one of the study area. Other data will be collected as needed.
- **Procedure:** To test hypothesis 1.1, raster data of parameters that influence mosquito distribution (rivers, wetlands, urban areas, roads, population and elevation) were combined using a Multi-Criteria Evaluation in Idrisi GIS package. This produced a map of potential exposure to malaria vectors which is used as a proxy for risk of malaria transmission. All the data layers were gridded at 1km spatial resolution. A set of distance layers had been created for discrete factors using standard GIS operations. All factors were subsequently standardized into a continuous common numeric range on a byte 0-255 probability scale using a fuzzy function based on knowledge of mosquito interaction with the factor. Weights were generated for each factor based on the importance of the factor to malaria transmission by expert opinions and then assigned using Analytical Hierarchy Process. The risk maps produced were validated statistically using data on *An. darlingi* distribution and malaria case data from some parts of the study area. See preliminary results (Fig. 3,4,5)

5. Preliminary Results

- Areas of high to moderate risk corresponded with locations of some of the anophelines collected.

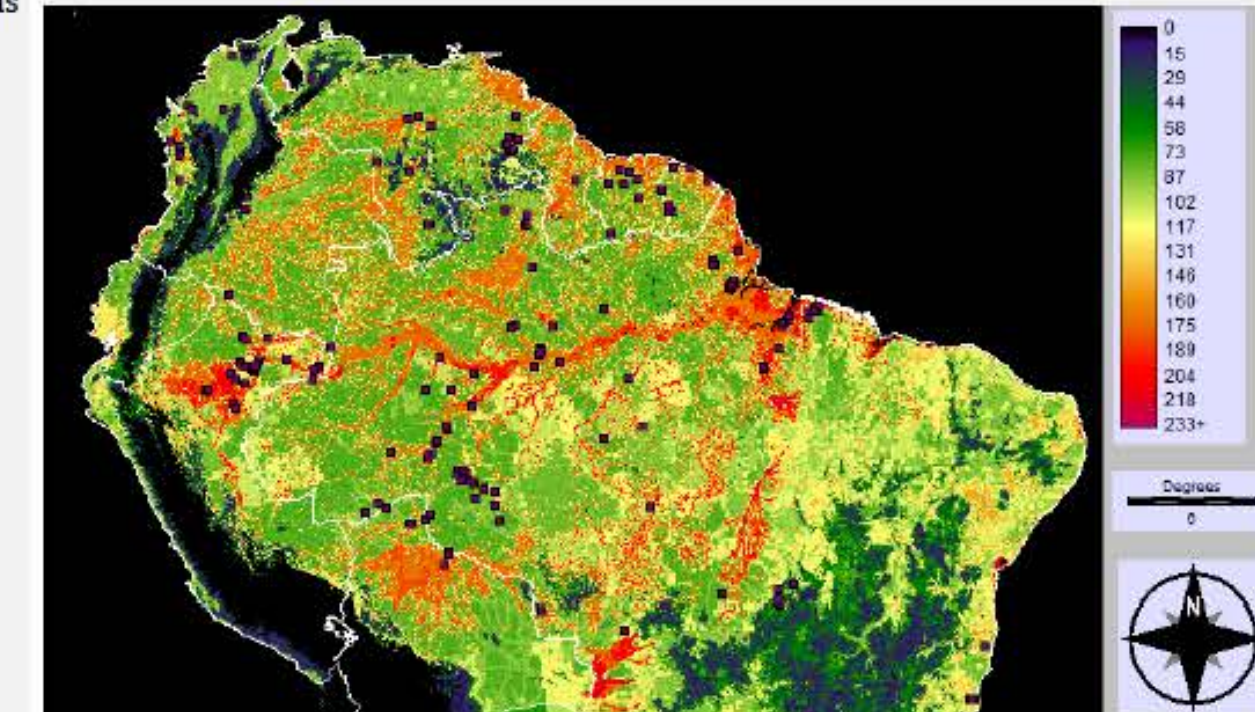

Figure 3: Potential risk of exposure to malaria vectors across NSA (0 indicate little or no risk while 233 indicate high risk)

- Risk scores for mosquito occurrence points were significantly higher than those generated randomly (Fig. 4).

Figure 4: Plot showing the MCE risk values for randomly sampled points and for occurrence points of a DV, *An. darlingi*

6. Conclusion

Findings from preliminary results suggest that the MCE approach is a viable method to modeling spatial risk. The high resolution risk map produced aligned well with sampled vector points and may therefore be used to plan control of malaria vectors. Further analysis is planned to generate and validate risk maps with actual measures of malaria transmission, results of which could be used to plan containment of future outbreaks.

Multi-scale Modeling and Assessment of Malaria Risk in Northern South America

Alimi, T. O.¹; Fuller, D. O.^{1,2} and Beier, J.C.^{1,3}

INTRODUCTION

Malaria as a public health problem has become a priority for control efforts worldwide. The global consensus is that its elimination is crucial for continual development. Ongoing research projects in different regions, including South America (SA), try to improve our understanding of the disease dynamics. Their goal is to establish a new framework that would lead to new intervention strategies for malaria elimination in areas where the disease is seasonal. One of such investigations is undertaken by the International Centers of Excellence in Malaria Research (ICEMR) under a National Institutes of Health grant.

While only about 3% of the global malaria burden is borne by SA, undertaking malaria research in the region is currently important because an estimated 23 million people are still at risk and approximately about 80% of clinical cases are found in **Northern South America (NSA)**. A key factor limiting effective control is lack of data and uneven implementation of control measures, including use of bednets, sprays, early diagnosis, and treatment. As part of the ICEMR investigation, this project seeks to model the spatial patterns of malaria risk in NSA through vector distribution and land-use changes. Furthermore, I intend to investigate the perceptions of malaria risk in order to identify barriers to adoption and how they can be circumvented.

SIGNIFICANCE

Spatial distribution of malaria risk is still perceived as broadly categorized by the WHO's traditional risk maps which are highly generalized, of low resolution and have broad categories with uncertain boundaries (see da Nunes-Silva et al. 2012). There is need for up-to-date high resolution risk maps which can aid malaria control efforts. Secondly, modeling distribution of principal malaria vectors and land use changes which may explain the observed distribution and risk are useful tools which would guide future management strategies. Finally, understanding the perceptions of at risk populations may help address barriers to adoption of interventions and influence policies. Overall, findings will empower NMCPs to achieve effective control and move them closer to elimination.

AIMS

Specific Aim 1: Model the spatial patterns of malaria risk through vector distribution and land use changes

- **Hypothesis 1.1:** GIS-based Multi-Criteria Evaluation (MCE) model can accurately predict spatial extent of malaria risk areas. **Objective:** Generate risk maps that represent risk of malaria transmission.
- **Hypothesis 1.2:** The Maximum Entropy (Maxent) model can accurately depict actual and predict potential distribution of three Anopheles species. **Objective:** Model observed and potential spread of *An. albimanus*, *An. darlingi*, and *An. funestus*.
- **Hypothesis 1.3:** Land-use changes can explain the variations in predicted malaria risk. **Objective:** Characterize land use land cover (LULC) and investigate changes in areas of risk.

Specific Aim 2: Investigate the perceptions of malaria risk in order to identify barriers to adoption and how they can be circumvented.

- **Hypothesis 2.1:** Knowledge of perception of malaria risk can aid design of malaria control strategies. **Objective:** Obtain and analyze data on subjective perceptions of risk.
- **Hypothesis 2.2:** Identification of barriers to adoption of malaria control interventions provide means of tackling them. **Objective:** Analyze data addressing perceived barriers and policy implications.

*Only ongoing work on Hypothesis 1.1 is presented here

MATERIALS AND METHODS

NSA comprising of ten countries - Bolivia, Brazil, Colombia, Ecuador, French Guiana, Guyana, Panama, Peru, Suriname and Venezuela. These countries account for approximately 90% of clinical cases in the region.

Research approach: Due to the complexity of malaria problem, I'm employing an interdisciplinary approach to address the problem.

Materials: Raster data layers of environmental, climatic and anthropogenic parameters from satellite imagery, weather monitoring stations, global land cover and population data were collected from WorldClim, Digital Charts of the World, Globcover and Landsat. Vector data was collected from field sampling by our collaborators and the Walter Reed Biosystematics Unit. Sociological data would be collected through questionnaires to be administered in one of the study area. Other data will be collected as needed.

Procedure: To test hypothesis 1.1, raster data of parameters that influence mosquito distribution (rivers, wetlands, urban areas, roads, population and elevation) were combined using a Multi-Criteria Evaluation in Idrisi GIS package. This produced a map of potential exposure to malaria vectors which is used as a proxy for risk of malaria transmission. All the data layers were gridded at 1km spatial resolution. A set of distance layers had been created for discrete factors using standard GIS operations. All factors were subsequently standardized into a continuous common numeric range on a byte 0-255 probability scale using a fuzzy function based on knowledge of mosquito interaction with the factor. Weights were generated for each factor based on the importance of the factor to malaria transmission by expert opinions and then assigned using Analytical Hierarchy Process. The risk maps produced were validated statistically using data on *An. darlingi* distribution and malaria case data from some parts of the study area. See preliminary results

RESULTS

Areas of high to moderate risk corresponded with locations of some of the anophelines collected.

Risk scores for mosquito occurrence points were significantly higher than those generated randomly.

Comparing mean of random and DV points for MCE risk map - $p < 0.05$

CONCLUSION

Findings from preliminary results suggest that the MCE approach is a viable method to modeling spatial risk. The high resolution risk map produced aligned well with sample vector points and may therefore be used to plan control of malaria vectors. Further analysis is planned to generate and validate risk maps with actual measures of malaria transmission, results of which could be used to plan containment of future outbreaks.

Jaime Serra Páez Periodista y artista multidisciplinar. En su último 25 años ha dirigido la infografía de algunos de los principales medios de España, ECN, y Latinoamérica. En su trabajo artístico utiliza los métodos a su lenguaje propio de la infografía científica para hacer formaciones perfectas y a su propio mundo personal. Su obra se ha expuesto en Estados Unidos, Argentina, México y España. Recientemente con la prestigiosa Society for News Design como el infógrafo más innovador del mundo (2012-2013). Su obra más reciente del 2012, resultado de las infografías de "La Vanguardia".

Tres historias verdaderas

Los datos son materia prima, en bruto no tienen utilidad. Deben ser procesados y transformados a un lenguaje visual para ser comprendidos. La herramienta que ilustra la información que contienen es la infografía. Una herramienta de comunicación naturalmente asociada a la divulgación científica pero que, como cualquier otra herramienta de comunicación humana, puede nacer hecha o sembrada, realista o ficción. Los datos científicos, recogidos con los actuales tecnologías capaces de prescindir de la intermediación del individuo, son objetivos. Proclamante por eso no pueden aportar nada sobre el individuo: no pueden ser verdad. La verdad contiene un componente de interpretación que permite que cada individuo disponga de la tuya propia. Son los datos aplicados a lo que hace una persona concreta, en un momento dado concreto, sobre un tema concreto lo que puede resultar revelador para otro individuo. Porque en la intimidad todos los seres humanos, por analogía u oposición, nos encontramos.

Café a diario

La relación que mantengo con el café es dual: por una parte puedo llegar a consumirlo de modo compulsivo, casi como una adicción, por otra parte la reacción de mi organismo a los lacteos -no me gusta solo- me obliga a reducir o abandonar por completo su consumo durante días.

Durante el año 2012 contabilicé las tazas de café que tomaba a partir de las manchas que dejaban sobre hojas de papel.

Del número total de tazas existen dos tipologías: café cortado y café con leche, usando un modelo de taza de diferente diámetro para cada caso. Con el fin de otorgarle mayor exactitud a la contabilización, utilicé las mismas tazas todo el año.

Para la visualización utilicé una hoja de 25 cm x 50 cm para cada mes. Como debía transportar las hojas a todas partes era necesario doblarla. La dimensión de la hoja elegida permitía que, doblada cinco veces sobre su mitad y sucesivamente desplegada, dibujase veinte y dos cuadrados de 8 cm cada uno, una forma ligeramente mayor que el diámetro de la taza de café con leche. A modo de calendario, cada cuadrado correspondía a un día, reservando el último para el nombre del mes y otras anotaciones.

We use written language for multiple purposes:

To communicate clearly, or to explore ideas, or to arouse emotions...

Why should visualization be different?
